**I bought this book to help get me with my postgrad research in computer vision and I am really happy
with it. It is very nicely written in a clear, easy style. It explains things carefully rather than formally
'deriving' them and it provides lots of nice simple examples in Matlab to show the concepts. I like
especially the chapter on morphology which is much simpler to understand than I had found in books
especially about morphology. It also has a really nice website where you can get all the images and
examples in the book and play around and modify the code. Overall, I think this is a really nice book.
